The first consolidated textbook explaining the mechanism of clinical signs commonly seen in medicine. *Mechanisms of Clinical Signs* is the first consolidated text of its kind; designed to help medical students and junior doctors understand the pathophysiological mechanisms behind clinical signs. Unlike existing clinical examination textbooks which are predominantly organised by disease systems and states, *Mechanisms of Clinical Signs* is arranged by body system; bridging the gap between identifying clinical signs and understanding the causes behind them. Presented in a useful handbook style, *Mechanisms of Clinical Signs* discusses the evidence base and clinical value of each clinical sign to assist with interpretation. Examples are plentiful and include such signs as distinctive tremors in a Parkinson's disease patient and red hands on a patient with liver disease. As well as being an easy-to-follow reference for clinical signs seen on the ward, *Mechanisms of Clinical Signs* is an excellent study aid - particularly useful for those preparing for 'Viva' or 'OSCE' practical stations. The ability to accurately identify and interpret clinical signs of disease upon examination is a vital first step in correct diagnosis and treatment. *Mechanisms of Clinical Signs* is therefore an essential textbook for medical students and new practitioners. Online StudentConsult resources accompany *Mechanisms of Clinical Signs* upon purchase.
